## Background

- Research on autophagy as a key regulator of neurodegeneration has increased recently.
- Caloric restriction (CR) is an anti-aging regimen that stimulates autophagy.
- Complete understanding of miRNA expression change following CR could reveal how calorie restriction prevents neurodegeneration via autophagy.

## Methodology

mice

networks

profile after dieting

Conclusion

1. We show that a lncRNA-miRNA-target gene regulation network is may involved in the neuroprotection via autophagy in the CR-aplied mouse brain.

- 1. Through the integrated analysis, we identified 8 miRNA-mRNA pairs, and 36 lncRNA-miRNA pairs.
- 2. Gm15564, miR137/670, PRKA1/2 axis is the most central subnetwork.
- 3. Using mirGen, we discovered that miRNAs targeting autophagy-related genes had the greatest impact on glioma and MAPK signaling pathways.
